

# Cassini ISS Astrometry by the Astronomy Unit at Queen Mary, University of London - An Overview

Nick Cooper  
Carl Murray, Mike Evans, Kevin Beurle, Gareth  
Williams

Queen Mary, University of London (QMUL)

# Cassini Imaging (so far)

- Since start of mission:
  - 306305 images (incl. ~26000 from Jupiter)
  - ~17000 hours
- QMUL contribution:
  - 34269 images (11.2 %)
  - ~1470 hours (8.7 %)

Observation time-span (Saturn) 2004-2012

# ISS Sequence Design at QMUL

- SATELLITE ORBITS ('SATELORB') 12262
- MUTUAL EVENTS 4246
- SATELLITE SEARCH 923
- F RING 12032
- OTHER 4806

# Cassini Imaging Science Subsystem

## Wide Angle Camera (WAC)

1024 x 1024 12-bit CCD  
200 mm focal length refractor  
FOV 3.5 deg (12.3 arcsec /pixel)  
18 filters on 2 wheels

## Narrow Angle Camera (NAC)

1024 x 1024 12-bit CCD  
2000 mm focal length reflector  
FOV 0.35 deg (1.23 arcsec /pixel)  
24 filters on 2 wheels

# Astrometry

- CAVIAR software package (QMUL).
- Camera pointing correction.
- UCAC2/Tycho2 catalogues.
- Nearest pixel, centroid or limb-fitting.
- Raw images.

# Image Projection Algorithm

1. Given  $\alpha$  and  $\delta$ , the right ascension and declination, respectively, of the pole of the primary body in the J2000 frame (Table 2), rotate the position vector of the target satellite from the planetocentric to the J2000 frame:

$$\begin{aligned} \mathbf{S}_{t-\tau} &= \begin{pmatrix} S_x \\ S_y \\ S_z \end{pmatrix} \\ &= \begin{pmatrix} -\sin \alpha & \cos \alpha & 0 \\ -\cos \alpha \sin \delta & -\sin \alpha \sin \delta & \cos \delta \\ \cos \alpha \cos \delta & \sin \alpha \cos \delta & \sin \delta \end{pmatrix} \begin{pmatrix} s_x \\ s_y \\ s_z \end{pmatrix}. \end{aligned} \quad (\text{A.1})$$

2. Compute the pointing vector  $\mathbf{p}_t$  from the Cassini spacecraft to the target satellite in the J2000 frame:

$$\mathbf{p}_t = \mathbf{S}_{t-\tau} - \mathbf{A}_{t-\tau}. \quad (\text{A.2})$$

$\mathbf{A}_{t-\tau}$  and  $\mathbf{S}_{t-\tau}$  are the position vectors of the spacecraft and target satellite, respectively, in the J2000 frame, at the one-way light-time-corrected observation time (note that this expression includes light-time and stellar aberration corrections; see, for example, Seidelmann (1992, p. 133)). The position vector for the spacecraft may be obtained from the tour kernel (Table 2) using the SPICE *spkpos* routine.

3. Rotate the unit pointing vector from the J2000 frame to the camera-body frame using the C-matrix:

$$\hat{\mathbf{P}}_t = \begin{pmatrix} P_x \\ P_y \\ P_z \end{pmatrix} = \mathbf{C} \hat{\mathbf{p}}_t, \quad (\text{A.3})$$

where

$$\mathbf{C} = \mathbf{R}_3(\phi) \mathbf{R}_1(90^\circ - \delta) \mathbf{R}_3(90^\circ + \alpha) \quad (\text{A.4})$$

and  $\alpha$ ,  $\delta$ , and  $\phi$  are, respectively, the nominal right ascension, declination and twist angles for the camera optical

axis, in degrees (see Table 1), and  $\mathbf{R}_i$  is the  $3 \times 3$  rotation matrix about the  $i$ th axis.

4. Transform from the camera body frame into image coordinates  $(s, l)$ , where  $s$  is sample and  $l$  is line, via the projection (following Owen, 2003):

$$\begin{pmatrix} s \\ l \end{pmatrix} = \sigma \begin{pmatrix} K_x & K_{xy} \\ K_{yx} & K_y \end{pmatrix} \begin{pmatrix} x + \Delta x \\ y + \Delta y \end{pmatrix} + \begin{pmatrix} s_0 \\ l_0 \end{pmatrix}, \quad (\text{A.5})$$

where

$$\begin{pmatrix} x \\ y \end{pmatrix} = \frac{f}{P_z} \begin{pmatrix} P_x \\ P_y \end{pmatrix}, \quad (\text{A.6})$$

$$\begin{pmatrix} \Delta x \\ \Delta y \end{pmatrix} = \begin{pmatrix} xr^2 & xy & x^2 \\ yr^2 & y^2 & xy \end{pmatrix} \begin{pmatrix} \epsilon_1 \\ \epsilon_2 \\ \epsilon_3 \end{pmatrix} \quad (\text{A.7})$$

and

$$r^2 = x^2 + y^2. \quad (\text{A.8})$$

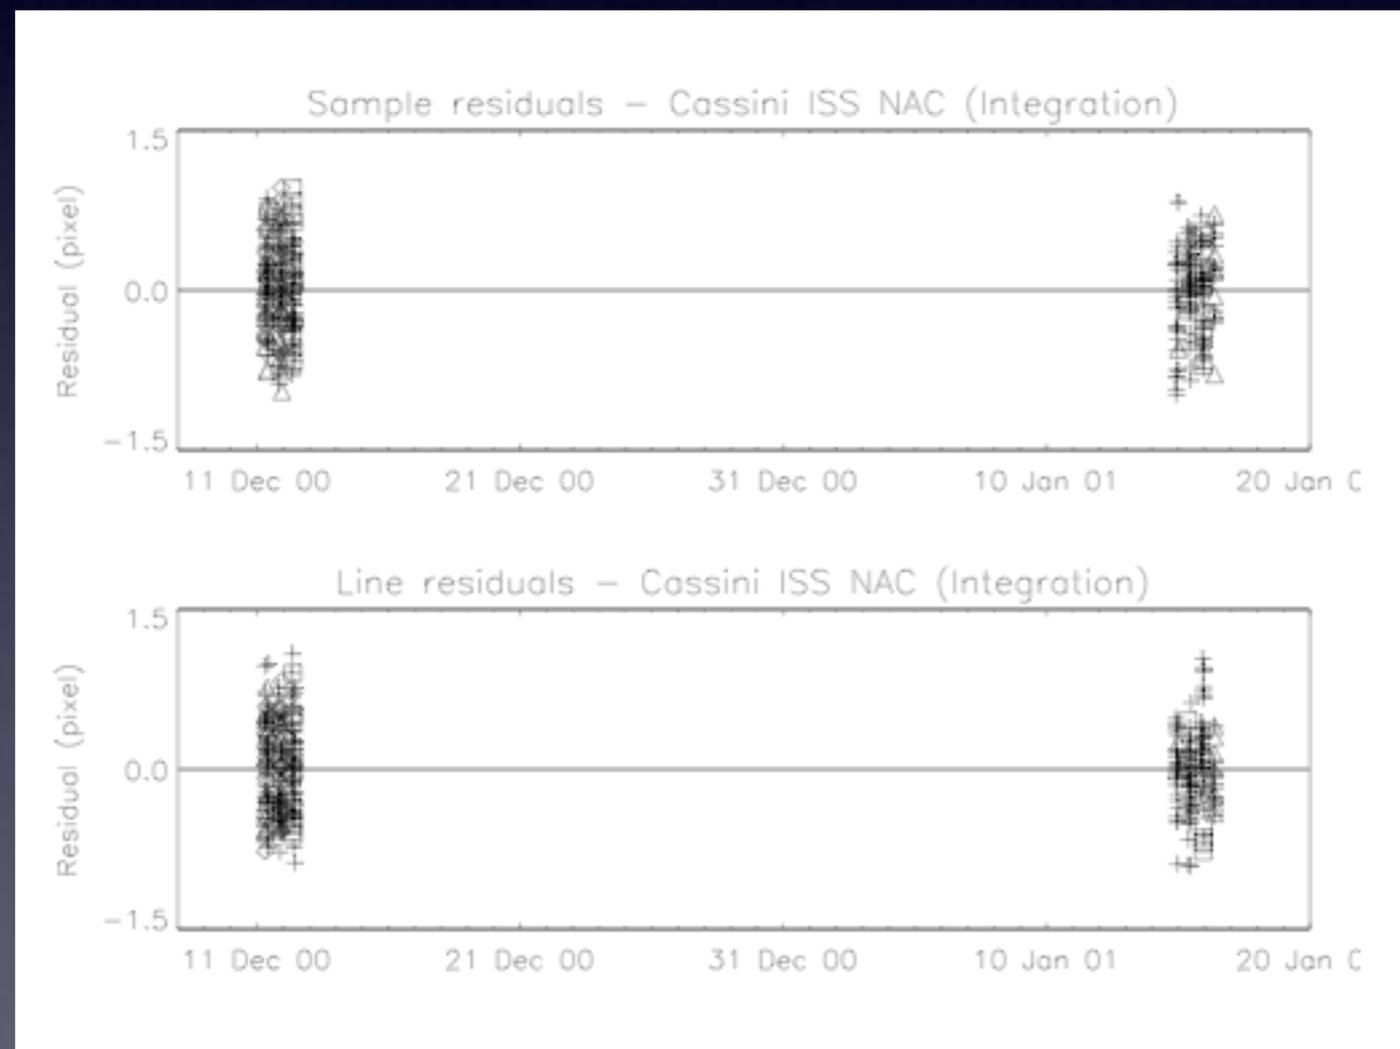

Table 3  
JPL Cassini NAC calibration results (Owen, 2003)

Parameter	Value	Units
$f$	2002.703	mm
$\epsilon_1$	8.28	$\times 10^{-6} \text{ mm}^{-2}$
$\epsilon_2$	5.45	$\times 10^{-6} \text{ mm}^{-1}$
$\epsilon_3$	-19.67	$\times 10^{-6} \text{ mm}^{-1}$
$K_x$	83.33333	samples/mm
$K_{xy}$	0.0	samples/mm
$K_{yx}$	0.0	lines/mm
$K_y$	83.3428	lines/mm

Owen (2003), Cooper et al. (2006)

# Inner Satellites of Jupiter

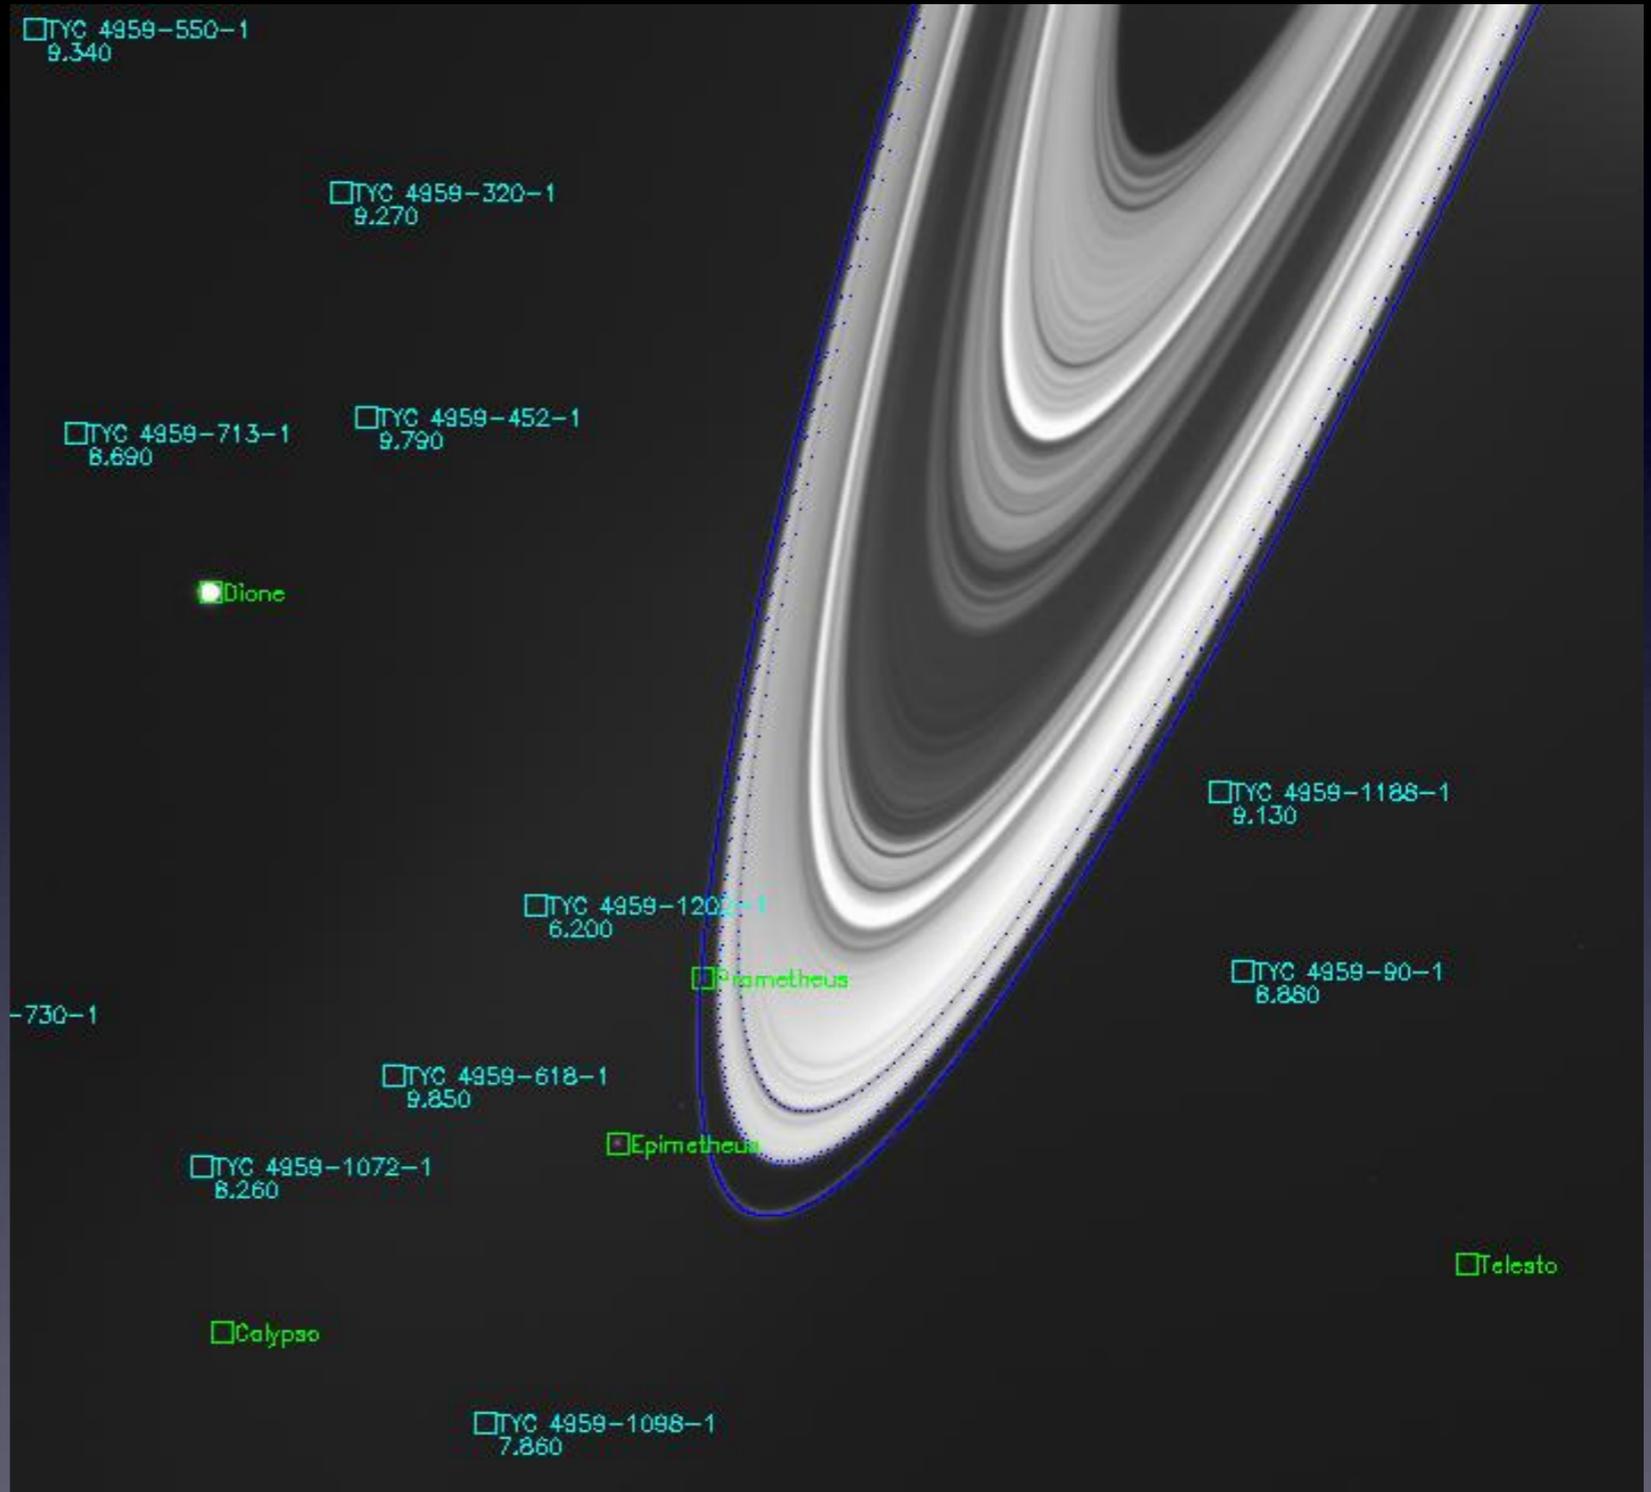

- Amalthea (239), Thebe (50) (Cooper et al. 2006)
- Metis (28), Adrastea (23) (unpublished)

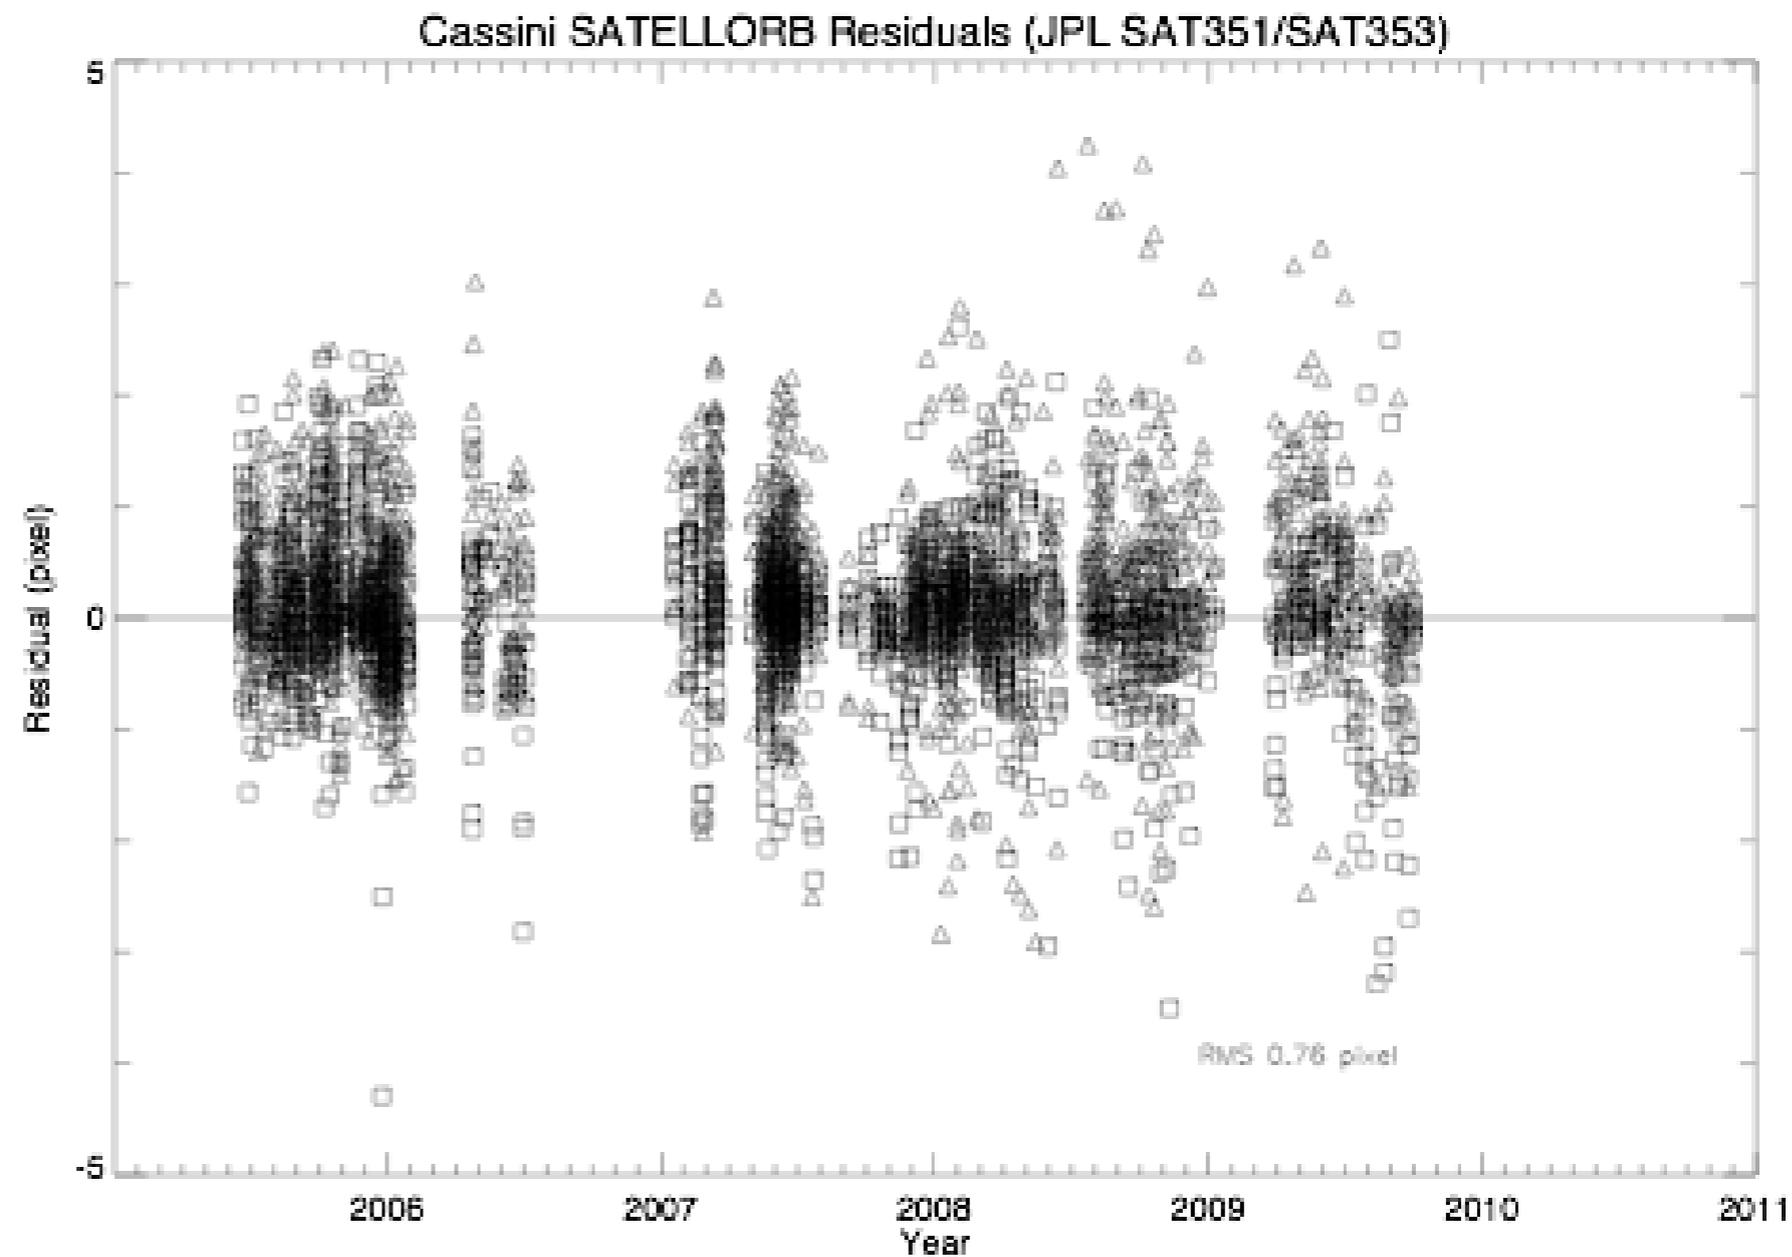

Observations using images from Dec 2000 and Jan 2001

# SATELLORB Observations

- Emphasis on the small inner satellites ('The Rocks')
- ~2000 individual measurements since 2004
- Observation requests up to 2013
- Further observations anticipated from 2013 to end-of-mission in 2017
- Astrometric data reduction is ongoing

# Cassini ISS Mutual Event Observations

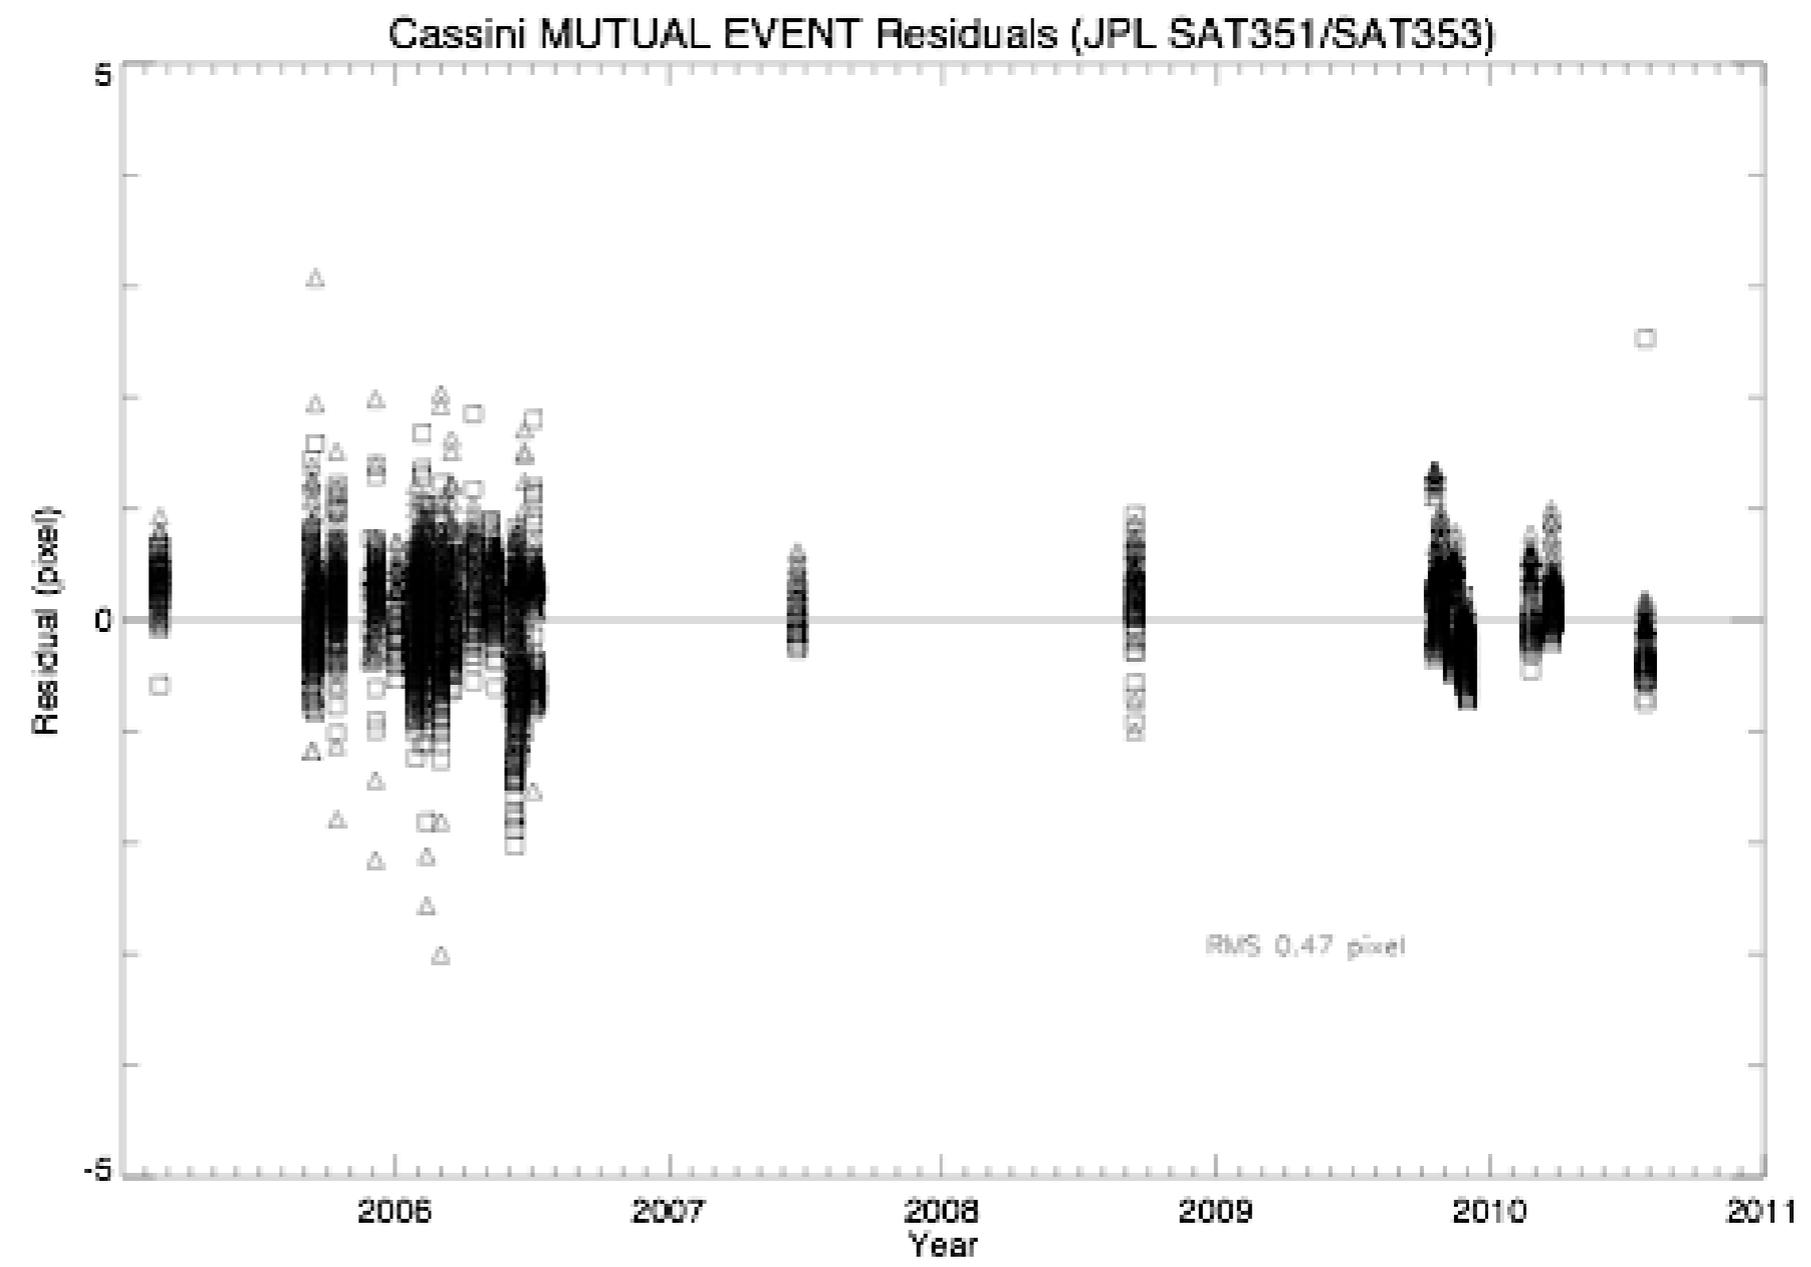

- 176 events observed since June 2004 (total ~3500 images)
- Planning in-place for 11 future events up to 2013
- Further observation requests from 2013 to end-of-mission in 2017
- Targets so far include all major satellites except Iapetus, and numerous small satellites
- Astrometric data reduction is ongoing
